

A

B

Posterior distributions of covariate-adjusted average predicted probabilities of neurosurgical intervention by ICH hemisphere. Estimates reflect the population-averaged probability across the observed covariate distribution, adjusted for ICH location, age, admission Glasgow Coma Scale score, ICH volume, intraventricular hemorrhage, an ICH laterality-by-location interaction, and a random intercept for study center. Dotted lines indicate posterior medians. Shaded regions represent the full posterior distribution. CrI = credible interval.
